On-Line Geometric Modeling Notes

Catmull-Rom Splines

The Catmull-Rom Spline is a local interpolating spline developed for computer graphics purposes. Its initial use was in design of curves and surfaces, and has recently been used several applications. This paper presents a simple development of the matrix form of this spline, using only intuitive concepts. The matrix form will arise from a simple geometrical argument that attempts to fix the tangents at certain control points to be the average of the slopes of the two line segments of the control polygon adjacent to each control point. The matrix equation is then just a simple result of matrix algebra.

Ferguson’s Parametric Cubic Curves

Given the two control points P₀ and P₁, and the slopes of the tangents P₀' and P₁' at each point, we can define a parametric cubic curve that passes through P₀ and P₁, with the respective slopes P₀' and P₁' by equating the coefficients of the polynomial function

\[ P(t) = a_0 + a_1t + a_2t^2 + a_3t^3 \]

with the values above. Namely

\[
\begin{align*}
P(0) &= a_0 \\
P(1) &= a_0 + a_1 + a_2 + a_3 \\
P'(0) &= a_1 \\
P'(1) &= a_1 + 2a_2 + 3a_3
\end{align*}
\]
Solving these equations simultaneously for \( a_0, a_1, a_2, \) and \( a_3 \), we obtain
\[
\begin{align*}
a_0 &= P(0) \\
a_1 &= P'(0) \\
a_2 &= 3[P(1) - P(0)] - 2P'(0) - P'(1) \\
a_3 &= 2[P(0) - P(1)] + P'(0) + P'(1)
\end{align*}
\]

Substituting these into the original polynomial equation and simplifying to isolate the terms with \( P(0), P(1), P'(0), \) and \( P'(1) \), we have
\[
P(t) = (1 - 3t^2 + 2t^3)P(0) + (3t^2 - 2t^3)P(1) + (t - 2t^2 + t^3)P'(0) + (-t^2 + t^3)P'(1)
\]
which is clearly in a cubic polynomial form. Alternatively, this can be written in the following matrix form
\[
\begin{bmatrix} P(t) \end{bmatrix} = \begin{bmatrix} 1 & t & t^2 & t^3 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 & 0 \\
0 & 0 & 1 & 0 \\
-3 & 3 & -2 & -1 \\
2 & -2 & 1 & 1 \end{bmatrix} \begin{bmatrix} P(0) \\
P(1) \\
P'(0) \\
P'(1) \end{bmatrix}
\]

This method can be used to obtain a curve through a more general set of control points \( \{P_0, P_1, ..., P_n\} \) by considering pairs of control points and using the Ferguson method for two points as developed above. It is necessary, however, to have the slopes of the tangents at each control point.

**Development of the Catmull-Rom Spline**

Given \( n+1 \) control points \( \{P_0, P_1, ..., P_n\} \), we wish to find a curve that interpolates these control points (i.e., passes through them all), and is local in nature (i.e., if one of the control points is moved, it only affects the curve locally). We define the curve on each segment \( P_iP_{i+1} \) by using the two control points, and specifying the tangent to the curve at each control point to be
\[
\frac{P_{i+1} - P_{i-1}}{2} \text{ and } \frac{P_{i+2} - P_i}{2}
\]
respectively.

Substituting these tangents into Ferguson’s method, we obtain the matrix equation

\[ P(t) = \begin{bmatrix} 1 & t & t^2 & t^3 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -3 & 3 & -2 & -1 \\ 2 & -2 & 1 & 1 \end{bmatrix} \begin{bmatrix} P_i \\ P_{i+1} \\ \frac{P_{i+1}-P_{i-1}}{2} \\ \frac{P_{i+2}-P_i}{2} \end{bmatrix} \]

or

\[ P(t) = \begin{bmatrix} 1 & t & t^2 & t^3 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -3 & 3 & -2 & -1 \\ 2 & -2 & 1 & 1 \end{bmatrix} \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -\frac{1}{2} & 0 & \frac{1}{2} & 0 \\ 0 & -\frac{1}{2} & 0 & \frac{1}{2} \end{bmatrix} \begin{bmatrix} P_{i-1} \\ P_i \\ P_{i+1} \\ P_{i+2} \end{bmatrix} \]

Multiplying the two inner matrices, we obtain

\[ P(t) = \begin{bmatrix} 1 & t & t^2 & t^3 \end{bmatrix} M \begin{bmatrix} P_{i-1} \\ P_i \\ P_{i+1} \\ P_{i+2} \end{bmatrix} \]

where

\[ M = \frac{1}{2} \begin{bmatrix} 0 & 2 & 0 & 0 \\ -1 & 0 & 1 & 0 \\ 2 & -5 & 4 & -1 \\ -1 & 3 & -3 & 1 \end{bmatrix} \]

This matrix representation defines the cubic curve that represents the portion of the total curve between two successive control points. It can be applied to all segments of the curve except for the first and last segments in which \( P_0 \) and \( P_n \) must be defined by a different method.
